SUMMARY

Results-driven Data Analyst fresher with a B.Tech in Artificial Intelligence & Machine Learning, skilled in transforming raw datasets into actionable business insights. Proficient in **Python, Power BI, Tableau, SQL, and DAX**, with demonstrated ability to design end-to-end analytics solutions — from data cleaning to interactive dashboard development. Delivered three real-world analytics projects analyzing over 18,300+ records, uncovering key business trends in customer retention, workforce attrition, and e-commerce sales performance.

EDUCATION

Kongu Engineering College B.Tech – Artificial Intelligence & Machine Learning	2023 – 2026
Kongu Polytechnic College Diploma – Mechanical Engineering CGPA: 80%	2020 – 2023
Sri Gayathri Matric School SSLC – 60%	2020

TECHNICAL SKILLS

- | | | |
|-------------------|----------------------|------------------|
| • Microsoft Excel | • Power BI | • Tableau |
| • Python (Pandas) | • SQL | • Google Colab |
| • Data Cleaning | • Data Visualization | • DAX (Power BI) |

PROJECTS

Customer Churn Analysis

Tools: Python · Pandas · Google Colab · Power BI · DAX | github.com/Logu-B/customer-churn-analysis

- Engineered a clean, analysis-ready dataset by processing 7,043 telecom customer records — resolving null values, correcting data types, and standardizing fields using Python and Pandas.
- Designed and deployed a 5-chart interactive Power BI dashboard, visualizing churn patterns across contract type, monthly charges, tenure, internet service, and payment method.
- Developed a DAX-powered customer lifecycle segmentation model (New / Mid / Loyal), enabling targeted retention strategies for high-risk churn segments.
- Implemented a consistent colour-coded visual system (Blue = Retained, Red = Churned) — reducing dashboard interpretation time for non-technical stakeholders.

HR Analytics Dashboard

Tools: Python · Pandas · Google Colab · Tableau | github.com/Logu-B/HR-analytics

- Streamlined a 1,470-record, 35-column IBM HR dataset by eliminating 4 zero-variance features and resolving data inconsistencies, improving data quality for downstream analysis.
- Built a comprehensive 5-view Tableau dashboard, exposing attrition trends across departments, salary bands, age groups, travel frequency, and job roles.
- Uncovered that Research & Development had the highest attrition count and employees earning ~\$4,100/month were most likely to leave — providing HR with data-backed retention priorities.

E-Commerce Sales Analysis

Tools: Python · Pandas · Google Colab · Power BI | github.com/Logu-B/ecommerce-sales-analysis

- Cleaned and pre-processed a 9,800-record Superstore sales dataset using Python (Pandas) in Google Colab, resolving missing values and standardizing date formats for time-series analysis.
- Built an interactive Power BI dashboard with 5 charts covering category sales, regional revenue, monthly trends, sub-category performance, and customer segment breakdown.
- Identified Technology as the top-selling category (~\$0.8M) and West region as the highest revenue generator (~\$0.7M), enabling data-backed regional strategy decisions.
- Discovered seasonal sales peaks in November and December and found the Consumer segment contributes 50.76% of total revenue — providing actionable insights for marketing planning.
